Statistical Computing Homework 4

Jieying Jiao

27 September 2018

Abstract

This is Jieying Jiao's homework 4 for statistical computing, fall 2018.

Contents

1	Exercise 3.3.2	1
2	Exercise 3.3.3	3

1 Exercise 3.3.2

```
##' define the loglikelihood function
loglik.my0 <- function(theta, sample) {</pre>
  n <- length(sample)</pre>
  if (sum(sample >=0 & sample <= 2*pi) < n) {</pre>
    print("sample is out of range")
  } else if(theta < -pi | theta > pi) {
    print("theta is out of range")
   1 \leftarrow sum(log(1-cos(sample-theta))) - n * log(2*pi)
   return(1)
  }
}
loglik.my <- function(theta, sample) {</pre>
  1 <- sapply(theta, FUN = loglik.my0, sample = sample)</pre>
  1
}
s \leftarrow c(3.91, 4.85, 2.28, 4.06, 3.70, 4.04, 5.46, 3.53, 2.28, 1.96,
       2.53, 3.88, 2.22, 3.47, 4.82, 2.46, 2.99, 2.54, 0.52)
curve(loglik.my(x, sample = s), -pi, pi)
```

$$E(X|\theta) = \int_0^{2\pi} x \frac{1 - \cos(x - \theta)}{2\pi} dx$$

$$= \frac{1}{2\pi} \int_0^{2\pi} x dx - \frac{1}{2\pi} \int_0^{2\pi} x \cos(x - \theta) dx$$

$$= \frac{1}{2\pi} \times \frac{1}{2} \Big|_0^{2\pi} - \frac{1}{2\pi} \int_0^{2\pi} x d \sin(x - \theta)$$

$$= \pi - \frac{1}{2\pi} \left[x \sin(x - \theta) \Big|_0^{2\pi} - \int_0^{2\pi} \sin(x - \theta) dx \right]$$

$$= \pi - \frac{1}{2\pi} \left[2\pi \sin(2\pi - \theta) + \cos(x - \theta) \Big|_0^{2\pi} \right]$$

$$= \pi - \frac{1}{2\pi} \left[-2\pi \sin(\theta) \right]$$

$$= \pi + \sin(\theta)$$

$$= \bar{X}_n$$

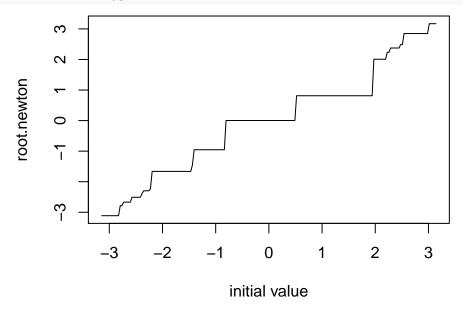

$$\Rightarrow \tilde{\theta}_n = \arcsin(\bar{X}_n - \pi)$$

```
library(pracma)
theta_0 <- asin(mean(s) - pi)
##' define derivitive of log-likelihood function
dev.loglik0 <- function(theta, sample) {
   dev.l <- sum(sin(theta-sample)/(1-cos(theta-sample)))
   dev.l
}
dev.loglik <- function(theta, sample) {
   dev.loglik <- sample) {
   dev.l <- sample) theta, FUN = dev.loglik0, sample = sample)
}</pre>
```

```
x1 <- newtonRaphson(fun = dev.loglik, x0 = theta_0, sample = s)$root
x2 <- newtonRaphson(fun = dev.loglik, x0 = -2.7, sample = s)$root
x3 <- newtonRaphson(fun = dev.loglik, x0 = 2.7, sample = s)$root
x1
## [1] 0.003118157
x2
## [1] -2.668857</pre>
```

[1] 2.848415

Newton-Raphson method gives 0.0031 as MLE when MOM 0.095 is initial value, -2.669 as MLE when -2.7 is initial value, 2.848 as MLE when 2.7 is initial value.

2 Exercise 3.3.3

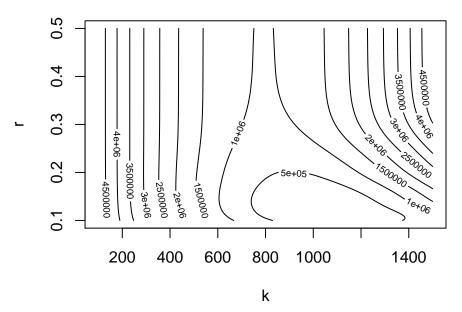

```
library(graphics)
library(Matrix)
##
```

Attaching package: 'Matrix'

```
## The following objects are masked from 'package:pracma':

## [1] 52.030534 348.204772
                                1.685714
```

Using BFGS methods, set constrain to make k, r, $sigma^2$ nonnegative, we get the MLE estimates $\hat{k} = 103.98$, $\hat{r} = 12.12$, $\hat{\sigma}^2 = 2.91$. Using inverse of negative hessian, we have these estimates' variance to be 52.03, 348.20, 1.69 respectively.

But there's problem that results will change dramatically with initial values. I just tried several different initial values, get the estimates and compare their corresponding loglikelihood. I just choose the one with maximum loglikelihood.
